

Boxed Lunch Aligning Device for Conveyor

Usage A device that aligns boxed lunches on the conveyor before entering the packaging machine.

Explanation A rod-type Elecylinder is used for pressing boxed lunches on the conveyor against the guide, aligning them before they enter the packaging machine. Conventionally, an air cylinder was used for the mechanism, but it was difficult to adjust the pressing force, which sometimes caused the workpiece to be scratched or caught. Adoption of the Elecylinder made it possible to make adjustments simply by entering numerical values, resulting in improved product quality.
