

# Centering device for beverage packaging

**Usage** A device that adjusts the beverage packaging conveyed to the center.

## Explanation

Previously, air cylinder was used in order to center the beverage packaging. The air cylinder had to be adjusted after regular maintenance to prevent it from damaging the packaging. However, the adoption of the Elecylinder that can adjust the speed through numerical input and with a good reproducibility, has led to the leveling of maintenance work. In addition, it saves energy as it does not require an air supply.
