

Ashtray conveyor

Usage A device that transfers ashtray horizontally to the next process.

Explanation A device that transfers the workpiece (ashtray) to the next process. The motorized Elecylinder was adopted for this device, for it was located in a place where a compressor can't be fixed in. Advantages include noise-free operation as it does not operate on an air supply. Using a data setting touch panel allows an easy setting for A (acceleration), V (velocity), D (deceleration) or its start point and the end point.
