

# Transfer device for boxed cosmetic products

**Usage** A mechanism that pushes products to the next conveyor when transferring between conveyors (right angle section).

## Explanation

In the past, air cylinders were used in the transfer (right-angle) section between conveyors to transport boxes containing cosmetics, but the impact occurred while pushing the box at times may overturn the box, deforming the box and causing the liquid contained to form bubbles.

Using the Elecylinder, the acceleration/deceleration control (A: acceleration, V: velocity, D: deceleration) became much easier, enabling the products to be transferred smoothly from conveyor to conveyor without affecting the products.
