

Electronic component transfer device

Usage The process where the product verified NG by the inspection through a camera is checked again through visual inspection.

Explanation

Conventionally, the process was carried out manually by the worker through the following steps; "reaching out the hand to pick up the NG verified product" → "visually inspect the product" → and "return the product if the product was verified OK". At times, depending on the worker's height, it would be difficult to reach the product, and in such instance, a stool was been used to resolve the issue. However, this process places a heavy burden on workers, and there were requests for improvement. By using the Elecylinder to draw the NG verified product to the worker, the worker no longer needs to take a posture that places a heavy burden on him or herself, improving the workability.
