

# Panel positioning device

**Usage** Adjusting the position where the panel conveyed is transferred to.

## Explanation

The worker pushes the panel conveyed on the stopper to adjust its position. The adjusted panel is drilled in the next process. The stopper functions to adjust the panel's stopping position. The panel comes in various sizes, and the stopper position had to be changed (adjusted) based on them.

Conventionally, an air cylinder was used here, but it was not easy to adjust the position and the position couldn't be adjusted to the middle.

Adopting the Elecylinder with the wireless teaching feature made it easier to adjust the stopper position, allowing it handle various types of panels.
